

MAGIC Database of Industrial Subsidies

With interest in industrial policy intensifying, data on the nature and scale of industrial subsidies and what they mean for global trade and competition is key.

The OECD MANufacturing Groups and Industrial Corporations (MAGIC) database of industrial subsidies is a firm-level resource of subsidy estimates and financial information for 525 of the largest manufacturing groups globally over the period 2005-2024. It is a tool for monitoring the use and incidence of industrial subsidies across key industrial sectors, which together make up the bulk of global manufacturing. The database provides key information on the value of subsidies across years, sectors, subsidy instruments, and regions. The public version of the OECD MAGIC database presented here displays results aggregated at the regional level derived from the confidential firm-level database, with a view to preserving the confidentiality and anonymity of individual firms included in the sample.

The companies covered in the OECD MAGIC database were selected because they are the largest in the 15 key industrial sectors covered by the database. These sectors include the production of automobiles, semiconductors, steel, and other key products and materials. For each such sector, the database covers the largest firms globally, irrespective of where they are based.

Industrial subsidies have reached their highest levels since the global financial crisis

Subsidies across 15 key industrial sectors have reached the highest level since the global financial crisis of 2008-2009. As a percentage of firms' sales revenue, industrial subsidies amounted to 1.3% in 2024, which was the second highest level on record after the previous peak. The 2009 peak, however, coincided with a severe global recession, when a 15% year-over-year collapse in sales mechanically inflated the subsidy-to-revenue ratio. This was not the case in 2023-24, which indicates the recent increase in industrial subsidies is more structural.

Monetary value of industrial subsidies reached record highs in 2023 and 2024

In nominal terms, subsidies across the 15 industrial sectors covered by the OECD MAGIC database totalled USD 108 billion in 2024, or USD 94 billion at constant 2015 prices. Both figures represent the second-highest levels observed to-date, following the record high seen in 2023. All three subsidy instruments covered by the OECD MAGIC database matter, with government grants, corporate income tax concessions, and below-market-borrowings having each contributed a sizable amount to the total industrial subsidies measured over the period 2005-2024.

Industrial firms in China receive more subsidies than their competitors elsewhere

Between 2005 and 2024, Chinese firms received on average three to eight times more government support than firms based in the OECD, a conservative estimate. These subsidies were also considerably higher than the support received by firms based in non-OECD economies such as Brazil, India, and Indonesia.

Level of industrial subsidies differs significantly across regions
Average for 15 key industrial sectors by firms' headquarters location for 2005-24 (% of annual firm revenue)

Industrial subsidies have grown across all regions, but remain highest in China

In almost all regions industrial subsidies were higher in 2024 than average over the period covered by the database (2005-2024). That said, the difference between subsidies received by Chinese firms and firms based elsewhere remained significant in 2024.

Renewable energy, semiconductors and heavy industries receive more subsidies than other sectors

Between 2005 and 2024, firms producing solar photovoltaic panels, semiconductors, aluminium, steel, and shipbuilding were – as a percentage of firms' sales revenue – the top five recipients of subsidies across the 15 sectors covered in the OECD MAGIC database.
